

HNglobal Setup

Cursor team (2 seats) + GitHub organization — instructions & printable checklist

Goal: one Cursor team named **HNglobal** with seats for **agivator@gmail.com** and **eyredn@gmail.com**; one GitHub org with private repos plus a shared area.

Cursor	Upgrade existing account → Teams plan named HNglobal Seat 1: agivator@gmail.com (Admin) · Seat 2: eyredn@gmail.com (Member or Admin)
GitHub	Create org HNglobal ; each person uses their own personal GitHub user and joins the org
Code layout	Shared repo(s) both can access + private repo(s) limited by GitHub Teams
Naming	Brand/team = HNglobal · Personal emails stay as seat logins · Profile handles are permanent once claimed

Avoid: creating a second Cursor billing account just to rename; two separate Pro subscriptions; putting “private folders” inside one shared repo and expecting secrecy (GitHub permissions are *repo-level*, not folder-level).

1. Cursor — upgrade & name the team

Do this while signed in as **agivator@gmail.com**. One Cursor account can belong to only one team at a time.

- 1 Open cursor.com/dashboard and sign in as **agivator@gmail.com**.
- 2 Choose **Upgrade to Teams / Create Team** (wording may vary).
- 3 Set the **team name** to **HNglobal**. Pick monthly or yearly billing.
- 4 Complete payment. Teams start on Standard seats; Premium (if available) can be upgraded per member later from the members menu.
- 5 Confirm you are a **paid Admin** on the team (needed if you use Cursor yourself).
- 6 Optional: set your display name in account settings. Optional profile handle at cursor.com/profile — **cannot be changed** after claiming.

Cursor checklist

- ☐ Signed in as **agivator@gmail.com**
- ☐ Upgraded / created Teams plan

- ☐ Team name set to **HNglobal**
- ☐ Billing payment completed
- ☐ agivator@gmail.com is Admin (paid seat)
- ☐ Display name updated (optional)
- ☐ Profile handle claimed only if sure (optional, permanent)

2. Cursor — invite the second seat

- 1 In the team dashboard, open **Members / Invite Members**.
 - 2 Invite **eyredn@gmail.com**. Choose role: **Member** (typical) or **Admin** (if they should manage billing).
 - 3 Have eyredn open the invite email, create/sign in to Cursor with that address, and **accept** the invite.
 - 4 Confirm both seats show as active on the Members page (billing is per active paid seat, prorated).
-

Second-seat checklist

- ☐ Invite sent to eyredn@gmail.com
- ☐ Role chosen (Member / Admin): _____
- ☐ Invite accepted; eyredn can open Cursor
- ☐ Both seats visible as active on Members
- ☐ Passwords stored securely for both accounts (password manager)
- ☐ 2FA enabled on both accounts (recommended)

3. GitHub — org + personal accounts

Use a **GitHub Organization** for the brand. Each person keeps (or creates) a **personal** GitHub user, then joins the org. Do not put company work only on one person's personal account.

- 1 Ensure each person has a personal GitHub account:
 - Person A (Agivator) — existing or new personal user
 - Person B (eyredn) — existing or new personal user ("separate GitHub account" for the second person)
 - 2 Create organization **HNglobal** at github.com/organizations/plan (Free org is fine for unlimited public/private repos; choose a plan if you need extras).
 - 3 Invite both personal GitHub users as org members. Make at least one an **Owner**.
-

- 4 Set org **Base permissions** to **No permission** (Settings → Member privileges) so people only see repos you explicitly grant.
- 5 Create GitHub Teams, for example:
 - **shared** — both people
 - **agivator-private** — Agivator only
 - **eyredn-private** — eyredn only

GitHub account / org checklist

- ☐ Personal GitHub ready for Agivator: @_____
- ☐ Personal GitHub ready for eyredn: @_____
- ☐ Org **HNglobal** created
- ☐ Both users invited and accepted
- ☐ Owner role assigned: _____
- ☐ Base permissions = No permission
- ☐ Team **shared** created; both members added
- ☐ Team **agivator-private** created
- ☐ Team **eyredn-private** created
- ☐ 2FA enabled on both GitHub users (recommended)

4. GitHub — private repos + shared area

Use **separate private repositories** for private work. A “shared directory” in practice = one or more shared repos both can access.

- 1 Create private repo **HNglobal/shared** (or several shared repos). Grant the **shared** team Write (or Maintain).
- 2 Create private repo(s) for Agivator-only work. Grant only **agivator-private**.
- 3 Create private repo(s) for eyredn-only work. Grant only **eyredn-private**.
- 4 Optional: move existing repos (e.g. from agivator-oss) into the HNglobal org via Settings → Transfer ownership; then re-apply team permissions.
- 5 Add a short README in each repo stating purpose and who owns it.

Repo checklist

- ☐ **shared** repo(s) created · team access: Write
- ☐ Agivator private repo(s) created · access limited
- ☐ eyredn private repo(s) created · access limited

- ☐ Verified: eyredn cannot open Agivator-only repos (and vice versa)
- ☐ Verified: both can clone/push **shared**
- ☐ Existing repos transferred / permissions updated (if any)
- ☐ README added to each repo

5. Connect Cursor ↔ GitHub

- 1 On each person's machine, sign into Cursor with their seat email.
- 2 Connect GitHub (Cursor settings / dashboard integrations) using that person's *personal* GitHub account that is in the HNglobal org.
- 3 Grant the GitHub App / OAuth access to the **HNglobal** organization (org owner may need to approve the app).
- 4 Open a shared repo in Cursor and confirm Cloud Agents / pull requests work as expected.
- 5 Repeat a quick smoke test for a private repo on the account that should own it.

Connect checklist

- ☐ Agivator: Cursor ↔ GitHub connected
- ☐ eyredn: Cursor ↔ GitHub connected
- ☐ HNglobal org approved access for the Cursor GitHub integration
- ☐ Shared repo opens and works in Cursor (both seats)
- ☐ Private-repo smoke test passed

6. Suggested order (one pass)

- ☐ ① Upgrade Cursor → name team HNglobal
- ☐ ② Invite eyredn@gmail.com and confirm seat active
- ☐ ③ Create GitHub org HNglobal + personal accounts / invites
- ☐ ④ Create Teams + shared / private repos + permissions
- ☐ ⑤ Connect each Cursor seat to GitHub and smoke-test
- ☐ ⑥ Store credentials in a password manager; enable 2FA everywhere

Quick reference
